

Oil-Canning Release of Liability Waiver

Oil canning is an **inherent characteristic of metal roofing and siding systems**. Oil canning is described herein as a visible waviness, bulking, or rippling of the metal that affects metal roofing and siding. Oil canning may occur with any metal roofing substrate including steel, copper, zinc, and aluminum. There are many causes of oil canning including: expansion and contraction of metal, overtightened fasteners, uneven substrate, underlayment not being flat, settling of a structure, mishandling of metal panels, and roll forming. Many conditions causing oil canning are beyond the control of manufacturing, and as such we offer no warranty nor guarantee of any form for the presentation of oil canning on Delta Metals products.

The purchasing party is herein notified and by signing this plain English legal disclaimer knowingly and willingly accepts to release Delta Metals and Delta Building Centers for all claims of product defect for the presentation of oil canning In Delta Metals roofing and siding systems.
